Đề bài Match the words/ phrases with their corresponding meanings.

Hello students. Today I'd like to tell you some information about types and sources of energy. Energy is classified into two main groups: renewable and non-renewable.

The energy generated from natural sources such as the sun, wind, rain, and tides is called renewable energy. They are plentiful and can be generated again and again. They also have low carbon emissions so they are considered green and environment-friendly. Moreover, using renewable energy can reduce your electricity bills. Unfortunately, solar energy can be only used during the daytime but not during night or the rainy season. Geothermal energy also can bring toxic chemicals beneath the earth's surface to the top and can create environmental changes.

Non-renewable energy is the energy taken from other sources that are available on earth. They are limited and will run out in the future. They can't be re-generated in a short time. Fossil fuels - natural gas, oil and coal - are examples of them. They are cheap and easy to use. However, when burnt, they release toxic gases in the air so they cause serious environmental changes such as global warming. And the important thing is that non-renewable sources will expire someday.

Question 10: Non-renewable energy will run out in 150 years.

- A. True
- B. False
- C. Not Given

Đề bài Read the passage carefully, then choose the correct answers.

The search for alternative sources of energy has led in various directions. Many communities are burning garbage and other biological waste products to produce electricity- Converting waste products to gases or oil is also an efficient way to dispose of wastes. Experimental work is being done to derive synthetic fuels from coal, oil shale, and coal tars. But to date, that process has proven expensive. Other experiments are underway to harness power with giant windmills. Geothermal power is also being tested. Some experts expect utility companies to revive hydroelectric power

derived from streams and rivers. Fifty years ago hydroelectric power provided one third of the electricity used in the United States, but to day it supplies only 4 percent. The oceans are another potential source of energy. Scientists are studying ways to convert the energy of ocean currents, tides, and waves to electricity. Experiments are also underway to make use of temperature differences in ocean water to produce energy.

Question 11: What is the best title of the passage?

- A. The Use of Water Products for Energy
- B. The Search for Alternative Sources of Energy
- C. Efficient Ways of Disposing of Waste
- D. New Discoveries in Geothermal Power

Question 12: In the second paragraph, the phrase “synthetic fuels” could best be replaced by which of the following?

- A. Biological fuels
- B. Low burning fuels

- A. Burning of garbage
- B. Geothermal power
- C. Synthetic fuels
- D. Electricity

Question 14: According to the author, the impracticability of using coal, oil shale and coal tars as sources of energy is due to _____ .

- A. their being time consuming
- B. their being money consuming
- C. the scarcity of sources
- D. the lack of technology their being money consuming

Question 15: What can be inferred from the last paragraph?

- A. Hydroelectric power will be the main source of energy
- B. Synthetic fuels will be the principal source of alternative energy
- C. Alternative energy will come from a variety of sources
- D. All alterenative production of energy will be delivered from water.
